Abstract

The present invention concerns an apparatus for resection of the soft or hard tissues. This apparatus comprises tissue-resection means 12 comprising a loop 14 integral with the front end of a supporting rod 18, and it is characterised in that it comprises means 22 for rotating the loop 14, in particular by rotating the rod 18 supporting the loop 14. By means of the invention it is possible to simplify radically the tissue-cutting movements, and the apparatus

is particularly advantageous in the context of resection of the prostate.
